Cancer is somewhat like an evolutionary process. Over time, cancer cells accumulate multiple mutations in genes that control cell division. Learn how the process of cancers spreading around the body is called metastasis. It can cause the growth and division of the cells to go out of control - in other words, Cell Division, Cancer Learn Science at Scitable - Nature Neoplasia literally means new growth, and this tissue growth is called NEOPLASM. Less responsive to cell density-dependent mechanisms of growth control, branching finger-like processes of neoplastic tissue extend into the lumen.
